

Ideation Phase – Problem Statement

Project: Book a Doctor App

Date: 18 June 2026

Problem Statement

The current process of finding the right doctor, checking availability, booking appointments, sharing reports, and tracking follow-ups is fragmented and time-consuming for patients.

Doctors often rely on manual or disconnected systems for appointment management, which causes schedule conflicts, poor visibility of patient bookings, and inefficient communication.

Administrators lack a centralized system to verify doctors, monitor platform activity, and manage healthcare service quality.

The project aims to build a centralized MERN-based healthcare booking platform that connects patients, doctors, and administrators through secure authentication, appointment workflows, and digital document handling.

Objectives

Enable patients to browse doctors by specialization, profile, availability, and ratings/experience information.

Allow secure appointment booking, cancellation, rescheduling, and status tracking.

Provide doctors with schedule management, patient appointment visibility, and access to uploaded reports/prescriptions.

Provide administrators with doctor approval, user/doctor oversight, and system monitoring.
